

Mobile App Testing Summary Report

Project: To-do-list Mobile App Testing

Platform: Android/IOS

Tester: Michael Abessolo

Objectives:

- Validate core mobile workflows (authentication, task creation, navigation).
- Evaluate usability, UI consistency, and offline behavior.
- Identify defects impacting user experience or functionality.

Scope Covered:

- Authentication
- Task Management (CRUD)
- Notifications
- Offline Mode
- UI/UX & Navigation
- Negative Testing

Summary of Results:

Total Test Cases: 35

Passed: 29

Failed: 4

Blocked: 2

Defects Logged: 6

Key Findings:

1. Offline-created tasks do not always sync reliably after reconnection.
2. Notification deep links sometimes redirect to the wrong screen.
3. The login button becomes unresponsive when the network drops mid-authentication.

4. Minor UI alignment issues discovered on smaller screen sizes.

Risk Assessment:

- Offline sync defects may lead to data loss → High Risk
- Notification routing bug impacts reminders → Medium Risk
- UI issues are cosmetic → Low Risk

Recommendations:

- Implement robust offline-first sync logic with a retry mechanism.
- Fix deep-link routing logic for notifications.
- Improve error handling during login in unstable networks.
- Apply responsive UI adjustments for smaller devices.

Conclusion:

The application is functionally stable for core task workflows. Critical issues exist in offline sync and notification

routing and should be addressed before release. Overall, app quality is acceptable with targeted improvements

required for reliability and user experience.
